This clone is from an A. gambiae BAC library (ND-TAM) provided by

F.H. Collins and sequenced by The Institute for Genomic Research

F.H. Collins and sequenced from newly hatched first instar larvae

to minimize the inclusion of DNA from microorganisms that inhabit

the gut. The DNA is derived from mixed sexes of larvae. The BAC

library was constructed at Texas A&M Universty BAC Center

University, College Station, Texas 77841-2123, USA using a Hindili
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       973 bp DNA linear GSS 19-WAY-2003 genomic clone ZMMBTa414P05, CC419273
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

Other name: BSC-3D-011; date: 3/1/60; Submitted to the Database of
Genome Survey Sequences (GSS) on 03/13/60; More information is
available at http://chrysie.tamu.edu/medicago.
Seg primer: pUC-D
Class: BAC subclone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Medicago truncatula (barrel medic)
Medicago truncatula
Bukaryota, Viridiplantae, Streptophyta; Embryophyta; Tracheophyta;
Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots;
rosids; eurosids I; Pabales; Pabaceae; Papilionoideae; Trifolieae;
    using universal primers. Sequencing reactions were primed from the PUC-C primer site (CAGGAAACAGCTATGACCATGATTACGA) in the pUC18 polylinker."
                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gabs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SALK 081478.48.30.x Arabidopsis thaliana TDNA insertion lines Arabidopsis thaliana genomic clone SALK_081478.48.30.x, genomic CC455370 CC455370.1 GI:31215393
Clones are derived from the bovine BAC library CHORI-240 (http://www.chori.org/bacpac/bovine240.htm). For BAC library availability, please contact Pieter de Jong (pdejong@mail.cho.org). Clones may be purchased from BACPAC Resources (http://www.chori.org/bacpac/ordering information.htm). This work was undertaken as part of the International Bovine BAC Mapping Consortium (IBBMC) by by University of Illinois at Urbana Champaign, USA with funds provided by grant No. AG202-34480-11828 from USDA-CSREES and Ac99-32205-8534 from USDA/NRI (Livestock Genome Seguencing Initiative)

//done library was constructed from mRNA isolated from CDNA library was constructed from mRNA isolated from somatic embryos (age ranging from 2 months to 9 months) cultured on MSD 20. The library was prepared using the Life Technologies pSuperscript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly (dT) sequence with a Not! restrictions site. Sall linkers adapters were ligated to the blunt-ended cDNA fragments were directionally cloned into the Not! Sall restriction site of the pSPORT! vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cells. This library was constructed in the laboratory of Dr. Lila Vodkin by Anu Khanma at the University of Illinois at Urbana-Champaign. e-mail: l-vodkinguiuc.edu"

/note="Vector: pBluescript II SK+; Site 1: ECORI; Site 2:
Xho1; The CDNA library was constructed from makna isolated
from mature seed pods of greenhouse grown plants prior to
sensecence for the cultivar KPI. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. ECORI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The CDNA fragments were
directionally cloned into the ECORI-XhoI restriction site
of the pBluescript vector. The ligated CDNA fragments
were transformed into DH10B host cells (GibcoBRL). This
library was constructed in the laboratory of Dr. Randy
Shoemaker."

//lone differentiating somatic embryos cultered on MSM6AC.
The library was prepared using the Stratagene pBluescript
IT 8K(+) library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with an XhoI restriction site. EcoRI
adaptors were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments were
directionally cloned into the EcoRI-XhoI restriction site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Email: est@watson.wustl.edu

/note="vector: pBluescript Sk+, Site_l: EcoR I; Site_2:
/note="decoration of the pBluescript of treated by spraying 2.0mm salicylic acid for 24, 36, 48
and 72 h. Complementary DNA was synthesized from mRNA
using a primer consisting of a poly(dT) sequence with a
XhoI striction site. EcoRI adapters were ligated to the
blunt-ended cDNA fragments followed by XhoI digestion. The
cDNA fragments were directionally cloned into the
BGORI-XhoI restriction site of the pBluescript vector. The
ligated cDNA fragments were transformed into XLI-Blue MRF'
host cells (Stratagene)."

TROPICALIS_SAUGNCE_ID: TGas080p20.q1k77

Sequencing primer: T7

This sequence is from a Xenopus Gene Collection (XGC) library
constructed by Aaron M. Zorn.

CONSTRUCTED Sequencing primed from Sug of poly A+ RNA from stages 10-13

gastrulae. ECORI-NotI cut cDNA was then ligated into pCS107 with

RCORI at the 5' end and NotI at the 3' end.

Vector: pCS107; Site 1: EcoRI: Site_2: NotI

Host: Escherichia coli XL1- blue.

/noce="Vector: pBluescript II XR; Site 1: EcoRI; Site 2:
Xhol; This cDNA library was constructed from mRNA isolated
from immature flowers of field grown plants. The cDNA
library was prepared using the Stratagene pBluescript II
XR library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a poly
synthesized from mRNA using a primer consisting of a poly
(dT) sequence with a Xhol restriction site. EcoRI adapters
were ligated to the blunt-ended cDNA fragments followed by
Xhol digestion. The cDNA fragments were directionally
cloned into the EcoRR-Xhol restriction site of the
pBluescript vector. The ligated cDNA fragments were
transformed into XL10-Gold host cells. This library was
constructed by Dr. Randy Shoemaker and Dr. John

Clones are derived from the bovine BAC library CHORI-240 (http://www.chori.org/bacpac/bovine240.htm). For BAC library availability, please contact Pieter de Jong (pdejong@mail.cho.org). Clones may be purchased from BACPAC Resources (http://www.chori.org/bacpac/ordering information.htm). This work was undertaken as part of the International Bovine BAC Mapping Consortium (IBBMC) by by University of Illinois at Urbana Champalgn, USA with funds provided by grant No. AG202-34480-11828 from USDA-CSREES and AG99-35205-8534 from USDA/NRI (Livestock Place: 134 row: H column: 2 Seg primer: SP6 Class: BAC ends.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC455370 10.x Arabidopsis thaliana TDNA insertion lines SALK 081478.48.30.x Arabidopsis thaliana genomic clone SALK_081478.48.30.x, genomic Arabidopsis thaliana genomic clone SALK_081478.48.30.x, genomic

| /note="vector: pSPORT1; Site_1: Not1; Site_2: Sal1; This CDNA library was constructed_from mRNA isolated from somatic embryos (age ranging from 2 months to 9 months) |
| cultured on MSD 20. The library was prepared using the Life Technologies pSuperScript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly (dT) sequence with a NotI restrictions site. Sal1 linkers adapters were ligated to the blunt-ended cDNA fragments followed by NotI digestion. The cDNA fragments were directionally cloned into the NotI-Sal1 restriction site of the pSPORTI vector. The ligated cDNA fragments were directionally cloned into the laboratory of Dr. Lila Vodkin by Anu Khanna at the University of Illinois at Urbana-Champaign. e-mail: l-vodkin@uluc.edu"

This is single pass sequence recovered from the left border of TDNA. This sequence lies within an annotated intron of At3g28260.
/lone libe "Ga-c1055"
// Actione mature seed pods of greenhouse grown plants prior to senescence for the cultivar XP1. Complementary DNA was synthesized from mRNA using a primer consisting of a synthesized from mRNA using a primer consisting of a poly (dT) sequence with a Xhoi restriction site. Bookl adapters were ligated to the blunt-ended cDNA fragments followed by Xhoi digestion. The CDNA fragments were followed by Xhoi digestion. The CDNA fragments were the pBluescript vector. The ligated cDNA fragments were transformed into The Ingared cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy Shoemaker."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /organism="Arabidopsis thaliana"

/clone_lib="Soybean induced by Salicylic Acid"
/clone_lib="soybean induced by He, C-Y from
RNA isolated from two-week seedlings (cultivar Kefeng 1)
treated by spraying 2.0mM salicylic acid for 24, 36, 48
and 72 h. Complementary DNA was synthesized from RNA
using a primer consisting of a poly(dr) sequence with a
xhol striction site. Ecozl adapters were ligated to the
blunt-ended CDNA fragments followed by Xhol digestion. The
CONA fragments were directionally cloned into the
EcoR:xhol restriction site of the pBluescript vector. The
ligated cDNA fragments were transformed into XLI-Blue MRP'
host cells (Stratagene)."

Sanger Xenopus tropicalis EST project 2001
TROPICALIS SEQUENCE ID: TGas080p20.q1kT7
Sequencing primer: Tropicalis EST project 2001
TROPICALIS SEQUENCE ID: TGas080p20.q1kT7
Sequencing primer: Tropicalis EST project 2001
This sequence is from a Xenopus Gene Collection (XGC) library
CONSTRUCTED by Aaron M. Zorn.
CDNA was Oligo dT primed from 5ug of poly A+ RNA from stages 10-13
gastrulae. ECORI-NotI cut CDNA was then ligated into pCS107 with
ECORI at the 5' end and NotI at the 3' end.
Vector: pCS107; Site 1: ECORI; Site 2: NotI
HOST: Escherichia coll XLL-blue.

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protesin that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein, and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the areance resistance operon of E. coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample. system comprising isolated protein and nucleic acid, and a detection

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein (2) a detection system that indicates a change in binding of the protein (2) a detection system to presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and an Arsk (encoded by part of the arsenic resistance operon of B. coli) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the Arsk sequence appearing as AMEG3440 binding to a nucleic acid sequence appearing as AMEG3440 binding to a nucleic acid sequence appearing the presence of analyte in a sample. The present sequence is the top strand of an oligonucleotide which binds to a planning expressed Arsk protein and is used in the biosensor of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human secretory or membrane proceins (ADAS4072-ADAS5710) and their coding sequences (ADAS2433-ADAS4071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.

The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as otticis media, sinustis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                 Genomic library for identifying diagnostic and therapeutic compositions, and for identifying virulence factors, regulatory elements and drug targets, comprises Moraxella catarrhalis nucleic acids.
                                                                                                                           Claim 1; Page 486-545; 545pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                 and meningitis

Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polymucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing polypeptide.

Claim 1; SEQ ID NO 10855; 489pp; English

The present invention describes a composition (I) comprising: carriers and immunostimulants, and a polypeptide (II) of a ovarian tumour polypeptide encoded by a polymuchotide (III) having a CDNA sequence (SI) from the 10912 nucleotide sequences as given in ABL/7023 to ABLB/7934, (III) encoding (II) having a sequence (S2), a T cell population of (II), or antigen presenting cells that express (II). (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological

sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount to a predetermined outoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for stimulating and/or expanding T cells with (III) or (III). is useful in design and preparation of ribozyme molecules for inhibiting to isolate a full length gene from a suitable library e.g., a tumour cells; and library using well known techniques

Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections

Disclosure; SEQ ID NO 1995; 267pp; English.

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life or inthis S. epidermidis infections. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site

The invention relates to an enzyme exhibiting endo-beta-1,4-glucanase activity (EC 3.2.1.4), comprising: (a) a polypeptide encoded by the DNA sequence appearing as ABX11841; (b) a polypeptide produced by culturing a cell comprising the DNA sequence under conditions where the DNA sequence is expressed; (c) an endo-beta-1,4-glucanase enzyme having at least 97% sequence identity to the amino acid sequence appearing as ABG76403; or (d) a polypeptide having endo-beta-1,4-glucanase activity that is encoded by a polymucleotide that hybridizes to the DNA under hybridisation conditions comprising 5x SC at 45 plusoc and washing conditions comprising 5x SC at 45 plusoc and washing conditions comprising by a polymucleotide construct comprising may of the DNA sequence, a polymucleotide construct comprising any of the DNA sequence.

The expression vector (comprising the following operably linked elements: an expression terminator), a cultured cell comprising the vector and transcription terminator), a cultured cell comprising the vector and expressing the enzyme, a method for degradation of cellulose-containing biomass that is treated with the enzyme or enzyme composition cited above and a hybrid endo-glucanase (exhibiting endo-beta-1,4-glucanase activity comprising the cellulase binding domain, CBD, of the enzyme, and a catalytic domain (CAD) from sources other than Bacillus sp. AA349 strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New enzyme exhibiting endo-beta-1,4-glucanase activity, useful in detergent compositions, oil industry textile finishing processes, biomass degradation, laundry, and stone washing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene, ds, endo-beta-1,4-glucanase; detergent; textile finishing process; oil industry; biomass degradation; laundry; stone washing; pulp processing; animal feed.

ö
DSM12648). The enzymes are useful in detergent composition, textile finishing processes, oil industry, biomass degradation, laundry and stone washing. The invention provides enzymes having substantial beta-1,4-glucanase activity under slightly acid to alkaline conditions and improved performance in pulp processing, textile treatment, laundry processes, extraction processes or in animal feed. The present sequence encodes the endo-beta-1,4-glucanase. (Updated on 27-OCT-2003 to standardise OS field)

Mutated alkaline cellulase for use as an enzyme for detergents is produced by deleting one or more amino acid residue groups from the 3·to 3/3-positions in SEQ ID No:1 and then inserting a peptide into the P-PSDB; ADE71407 deletion site.

Disclosure; SEQ ID NO 2; 31pp; Japanese.

The invention relates to a mutant alkaline cellulase derived from the Bacillus sp. KBM-S237 alkaline cellulase Bg1-237 (ABE71407). The mutant enzyme is created by deleting one or more amino acid residues between residues 343-373 of the wild-type enzyme, and then inserting a 2-15 residue peptide into the deletion site. The invention also encompasses a gane encoding a mutant alkaline cellulase of the invention, and vectors and host cells comprising a matent alkaline cellulase-encoding gene. The mutant alkaline cellulase so the invention have an optimum pf which is very close to the ph of laundry water (around pil 10.5) and are therefore useful as enzymes for detergents. The present sequence represents the gene encoding wild-type Bacillus sp. KSM-S237 alkaline cellulase Eg1-237.

By using this DNA sequence cellulase can be produced. This cellulase hydrolyses cellotriose or cellotetrose and does not hydrolyse cellobiose. Molecular weight is approx. 92K dalton and optimum pH is 9. (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sporulation associated gene; deactivation; deletion; sporulation suppression; sigB; spoIIE; spoIIEB; sigG; spoIVCB; spoIIIC; recombinant protein production; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ö
                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel alkaline cellulase gene from a Bacillus sp. The alkaline cellulase gene is used for the preparation of an alkaline cellulase useful as a textile detergent and a textile treating agent. This sequence encodes the Bacillus sp. alkaline cellulase N131b described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Alkaline cellulase gene useful for the preparation of an alkaline cellulase useful as a textile detergent and a textile treating agent

The invention relates to microorganisms (particularly Bacillus species)

In which one or more sporulation-associated genes active in the medium to latter stages of sporulation have been deactivated or deleted. Such genes include the sigE, sigF, spoIIS, s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacillus strain having genes associated with sporulation inactivated for use as hosts in more efficient production of recombinant proteins.

A heat resistant alkaline cellulase gene.

Claim 3; Page 6-10; 10pp; Japanese.

The invention relates to a novel heat resistant alkaline cellulase (AAB23180) from Bacillus sp. KSM-S237, and to the gene encoding it (AAA37493). The invention also encompasses variants of the heat resistant alkaline cellulase in which at least one amino acid residue is deleted, replaced or inserted. The Bacillus sp. KSM-S237 heat resistant alkaline cellulase gene was isolated using the Bacillus sp. No. 1139 alkaline cellulase gene derived PCR primers AAA97494-A97495. The Bacillus sp. KSM-S237 heat resistant alkaline cellulase gene can be used for the forcombinant production of heat resistant alkaline cellulase which can be formulated in detergent for cleaning applications. The present sequence represents the Bacillus sp. KSM-S237 heat resistant alkaline cellulase

Ozaki K; Tohata M, Ozawa T, Sawada K, Endo K,

Bacillus strain having genes associated with sporulation inactivated for use as hosts in more efficient production of recombinant proteins. WPI; 2003-140463/13. P-PSDB; ABP58993.

Disclosure; Page 20-25; 29pp; Japanese.

The invention relates to microorganisms (particularly Bacillus species)

In which one or more sporulation-associated genes active in the medium to latter stages of sporulation have been deactivated or deleted. Such genes include the sigE, sigF, spoilE, spoilES, sigG, spoilCB and spoilE genes.

The invention also relates to the recombinant production of a protein using the microorganism of the invention. As the microorganisms of the invention are incapable of producing spores, recombinant protein

CC invention are incapable of producing spores, recombinant protein

CC production is more efficient, with reduced formation of by-products, reduced energy loss, reduced consumption of culture medium, and increased speed of target protein production. In addition, protein production can be efficiently carried out over a longer period of time than is currently the case. The microorganisms can be used to recombinantly produce target proteins for use in a variety of applications, such as in foodstuffs, drugs, cleaning agents and toiletries. The present sequence represents a Bacillus Sp. KSM-64 sporulation-associated gene related to the invention.

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specifically binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a charge in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of a malyte in a sample, detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the areance operance of an analyte in a sample, and an ArsR (encoded by amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte, (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid sequence emprising oligonucleotides appearing as ACD28564-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligonucleotide which binds to a consideration of the presence of analyte in a sample. The present sequence is the top strand of an oligonucleotide which binds to a consideration and is used in the biosensor of the
                                                                                                                                                                                               ö
sequence comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleotide which binds to a chromosomally expressed ArsR protein and is used in the biosensor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Also included are a biosensor device for detecting the presence of the analyte in a sample, detecting the presence of an analyte in a sample, and the arsenic resistance operon of E. coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABUG3440 binding to a nucleic acid sequence comprising ollomucleotides appearing as ACD28594-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an alignment of analyte in a sample. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of

```
The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte, (2) an isolated nucleic acid containing a specifically binds the analyte, (2) an isolated nucleic acid containing a specifically by the protein; and (3) a detection system that indicates a change in binding of the protein; and consensor device for detecting the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte and analyte in a sample, detecting the presence operon of E. coll) protein comprising an amino acid sequence that is at least 90% indentical to amino acids 1-97 of the Arsk sequence that is at least 90% indentical to amino acids 1-97 of the Arsk sequence appearing as ABUG3440 binding to a nucleic acid sequence comprising the presence of analyte in a sample. The system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligonucleotide which binds to a chromosomally expressed Arsk protein and is used in the biosensor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                 New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

```

```
The invention relates to an isolated nucleic acid comprising any one of the full antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promiter operably linked to the nucleic acid (12) a host cell containing the vector; (3) an isolated concing a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide, (5) producing the polypeptide; (6) inhibited by the captured cor proliferation or the activity of agene in an operom required for proliferation or the activity of agene in an operom required for che gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) inhibits and the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism is present in a culture or collection of strains; or (13) identifying proteins or surfacense nucleic acids are useful for the activity; (11) a culture compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation in cells other candidate molecules for rational creatived for proliferation in cells other than S. aureus, S. typhimurium, creatived for proliferation in cells other than S. aureus, S. typhimurium, antisense sequences of the invention. Note: The sequence data for this continuences of the invention of the patent fid not form part of the prince of patent will rectly from MIPO at the present sequences of the invention of the continuences of the sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid arrepresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (AB2/21/96-AB2/1774) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; immune system disease; cytosine methylation; antiasthmatic; antiarteriosclerotic; antianaemic; cytostatic; nootropic; neuroprotective; anti-HIV; anticonvulsant; ophthalmological; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antinflammatory; cancer; eye disease; arteriosclerosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         80.8%; Score 20.2; DB 6; Length 2000; 88.0%; Pred. No. 1.2e+02;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 144; SEQ ID NO 3647; 577pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2000 BP; 714 A; 318 C; 295 G; 673 T; 0 U; 0 Other;
                                                                                                                  Arabidopsis thaliana stress regulated gene SEQ ID NO 3647.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated polymucleotide (I) and polymeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations are responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                   Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polymuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                            The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid returants. Alzheimer's disease, Alls, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                               for
neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease; gene;
                                                                                                                                                                                                                                                                        Nucleic acid comprising fragment of chemically modified gene, useful t
diagnosis and treatment of diseases associated with abnormal cytosine
methylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel tumour suppressor gene, referred to as LMt. The invention also relates to the field of cancer therapy and cancer diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an LMT. The present sequence is human LMt intron 2 DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel tumour suppressor gene, referred to as Lmt. The invention also relates to the field of cancer therapy and cancer diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an LMT. The present sequence is human Lmt reverse complement DNA

The invention relates to novel genes (ABA11004-ABA21534) and proteins C (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the genesitation. The mucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and covarian and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as mycocardial isochaemias; (d) wound healing (c) (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published pot_sequences

New nucleic acids or oligomers, useful for diagnosing or treating diseases associated with DNA transcription, e.g. immunological disorders, Werner syndrome, psoriasis, myocardial infarction, solid tumors or cancer.

Claim 1; SEQ ID NO 11; 32pp; English.

The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of \$46 sequences, and an oligomer that hybridises to or is identical or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA is dentical to the chemically pretreated DNA of genes associated with DNA is dentical cytosine methylation state and/or single nucleotide polymorphisms (SNPS) in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosting or treating diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary syndrome, themerculosis developmental disorders, parciasis, Rieger's syndrome, therrological disorders, intunological disorders, wardenburg infarction, hypertension, angiogenesic gisorders, wardenburg syndrome, Niemann-Pick disease, myelodysplastic syndrome, myentome, architis, oplyglutamine disorders, solid tumours or cancer. Sequences ABX28127-ABX28472 represent DNA transcription associated genomic DNA molecules of the invention. Note: The sequence data for this patent did not form part of the printed specification but the state that the syndromic format directly from the European Patent

WPI, 2000-318079/27.

Isolated nucleotide sequences of Neisseria meningitidis which can be in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea.

Claim 7; Page 253-260; 1760pp; English.

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA8244 represent corresponding to the sequences. AAA81260 to AAA81203 and AAB25620 to AAA82563 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA8121 trepresent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA8125 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all coused in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a medicament for treating, creventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all corpus Meningococcus B creation of sequences from the bacterium will also facilitate production of sequences from the bacterium cull also facilitate production of sequences from the bacterium cull also facilitate production of sequences from the bacterium cullennes have also been tried but none have successfully overcome artigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins chart may be presumed targets for the immune system and which are not antigenically overcome chartering.

```
The present invention describes the full length genome of Neisseria
menigitidis B (NWB). The sequences in AAF21544 and AAF21607 to AAF21613
corpresent fragaments of the NWB genomic sequence, as the sequence was too
long to go in a record on its own it was split into 8 sequences which
coverlap each other at the beginning and end of each sequence by 49980 bp
coverlap each other at the beginning and end of each sequence by 49980 bp
coverlap each other at the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated at the beginning of
AAF21608, and so on). AAF21545 to AAF21589 to AAF21606 represent proteins
converse which are used in the exemplification of the present invention.
The NWB genome and fragments from it have antibacterial activity, and can
be used in vaccines and gene therapy. Neisseria nucleic acids, proteins
and/or antibodies which binds to the proteins can be used in compositions
for treating or preventing infection due to Neisserial bacteria or as a
diagnostic reagent for detecting the presence of Neisserial bacteria or
of antibodies raised to Neisserial bacteria. Computer storage medium or computer databases can be used in a search to
identify open reading frames (ORFs) or coding sequences within the NWB
computer storage medium or computer databases can be used in a search to
identify open reading frames (ORFs) or coding sequences within the NWB
couter membrane proteins which are more effective in vaccines than the
couter membrane proteins currently used
                                                                                          Neisseria meningitidis; Neisseria gonorrheae; immunogenic; vaccine;
